

Crayfish

Ondřej Brejška, 2. A

I very love crayfish. They live in water and they can breathe there, because they have got gills. I have got crayfish in my house in an aquarium. I like to breed my crayfish. But that has got disadvantages. For example cleaning aquarium, feeding crayfish and I must play with them. I must separate youngers from their mother to other aquarium, because she wants to kill and eat them. They MUSN'T have dirty water!! They hate it and I too. Crayfish are placed to protected kinds of animals. They live in clean water, for example rivers and cisterns.

It's many kinds of crayfish, for example „*austropotamobius torrentium*,“ „*orconectes limosus*,“ „*pontastacus leptodactylus*,“ or „my“ crayfish „*procambarus cubensis*.“ Crayfish have claws and feelers. Claws for hunting eatables and for defence. They have feelers for control surface before them. They have two eyes on stalks. They are very speedy in water but they are very fast on dryland. They have fin on conclusion of tail. They carry ovum on little legs under tail. Youngers are hold on their mother. Crayfish eat worms, little fish, flies and special food for crayfish. They drop their hide, because they must grow up. They are very beatiful and we must help them.
